Complexity

- Let's watch a video!

Problem 1: linear search

- Given a size- n array A of integers and a target integer t , check whether t is in A .
- Please design a function that:
 - Takes an integer array A , its length n , and an integer t as parameters.
 - Returns true if t is in A and false otherwise.
- Please write **pseudocode** by writing a **loop**.

```
Search( $A, n, t$ )  
  for  $i$  from 1 to  $n$   
    if  $A_i = t$   
      return true  
  return false
```

Problem 2: linear search (recursion)

- Given a size- n array A of integers and a target integer t , check whether t is in A .
- Please design a function that:
 - Takes an integer array A , its length n , and an integer t as parameters.
 - Returns true if t is in A and false otherwise.
- Please write **pseudocode** with **recursion**.

```
Search( $A, n, t$ )  
   $t_0 = \text{Search}(A, n - 1, t)$   
  if  $t_0 = \text{true}$  or  $A_n = t$   
    return true  
  else  
    return false
```

Problem 3: Hanoi Tower

- Given an integer n , the fastest way to solve the Hanoi Tower problem is unique.
- Let's watch a **video**!
- Though you have read the code solving the Hanoi Tower problem, please still write **pseudocode** for it.

Problem 3: Hanoi Tower

Hanoi(f, v, t, d)

if $d = 1$

Move the disc from pillar f to pillar t

else

Move the top $d - 1$ discs from pillar f to pillar v by utilizing pillar t

Move the last disc from pillar f to pillar t

Move the $d - 1$ discs from pillar v to pillar t by utilizing pillar f

Hanoi(f, v, t, d)

if $d = 1$

Move the disc from pillar f to pillar t

else

Hanoi($f, t, v, d - 1$)

Move the last disc from pillar f to pillar t

Hanoi($v, f, t, d - 1$)

Problem 4: insertion sort

- Let's watch a **video**!
- Idea: Given a size- n integer array A whose first k elements are sorted (from small to large) and the remaining is not, insert the $(k + 1)$ th element into the first half to make the first $k + 1$ element sorted.

```
insertionSort(a non-repetitive array  $A$ , the array length  $n$ )  
  for  $i$  from 1 to  $n$   
    insert  $A_i$  to the proper place within  $A_{1..(i-1)}$  // how?  
    // now  $A_{1..i}$  is sorted
```

- Please refine the pseudocode to make it **precise**.
 - Make you (and your friend) know how to execute each step.

Problem 4: insertion sort

```
insertionSort(a non-repetitive array  $A$ , the array length  $n$ )  
  for  $i$  from 1 to  $n$   
    //  $A_{1..(i-1)}$  is sorted  
    insert  $A_i$  to the proper place within  $A_{1..(i-1)}$   
    // now  $A_{1..i}$  is sorted
```

```
insertionSort(a non-repetitive array  $A$ , the array length  $n$ )  
  for  $i$  from 1 to  $n$   
    //  $A_{1..(i-1)}$  is sorted  
    for  $j$  from  $i$  to 1  
      if  $A_j < A_{j-1}$   
        swap  $A_j$  and  $A_{j-1}$  // precise?  
      else  
        break  
    // now  $A_{1..i}$  is sorted
```
